Experiments in Météo France with AROME-PI

- 2 Case studies
- testing of different RADAR DA settings in AROME-PI 1.3km

Cannes:
195.5mm/24h
106.8 mm /1h

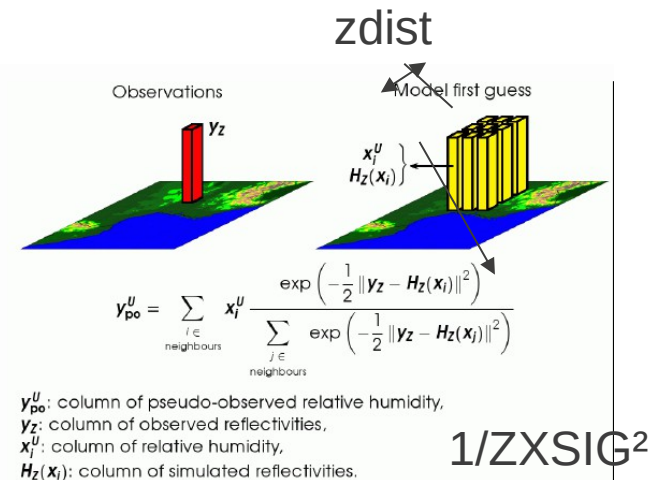

Experiments in Météo France with AROME-PI

AROME
11/10/16

- Thinning reduced (ZSAMPL_RADAR (BATOR), RMIND_RADAR, RFIND_RADAR 0.5x normal value
- Modify observation error :SIGMAO_COEF(13)=1.2
- Saturate pseudo humidity observation profile
- Increase search radius for suitable humidity profiles zdist in radar_profs.F90 (200km instead 100km) and increase standard deviation ZXSIG= $\sigma_z=5$ dBz instead 0.2dBz in inv_refl1dstat.F90
- Replace hydrometeor blending by profile supersaturation

AROME-PI did simulate the events satisfactorily, but:

- Underestimation of maximum precipitation
- Overestimation of area affected by light rain

Problems with Austrian RADAR data in 2016

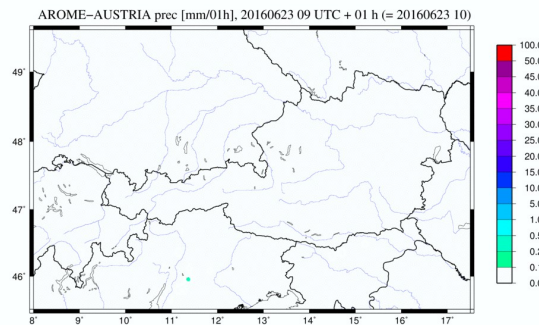

AROME
11/10/16

- In autumn 2015 HDF5-RADAR flags were changed: no_data -1 -> 255, undetect 0 -> 254 also gain and offset changed, but the changes were not fed into CONRAD

dry case: 20160623 09UTC +1h

AROME-NWC
no Doppler used

AROME-NWC
replace flags by old values

Better but:
no_data=-1 not really coded
->no_data->0=undetect
0->undetect
still hard coded values
in CONRAD , distinction
undetect/no_data unclear

External pre-thinning C-routine, might be later replaced by HARMONIE superobs script

“Latent Heat Nudging” with AROME cy38t1/cy40t1

AROME
17/10/16

- Method of Jones & Macpherson 1997 (UM, COSMO-Modell, WRF)
idea:

Error of 2D precipitation on the ground is proportional to the error of 3D latent heat release -> correct latent heat release by the ratio of observed and modelled precipitation on the ground -> improved forecast of rain/temperature?

$$\Delta\theta_{LHN} = \Delta\theta_{phys} \frac{RR_{obs} - RR_{model}}{RR_{model}} \text{ (Jones \& Macpherson)}$$

Advantages:

- Only 2D-RADAR data necessary, no B-Matrix needed
- Very efficient
- 4D-assimilation: observations at different time stamps can be applied

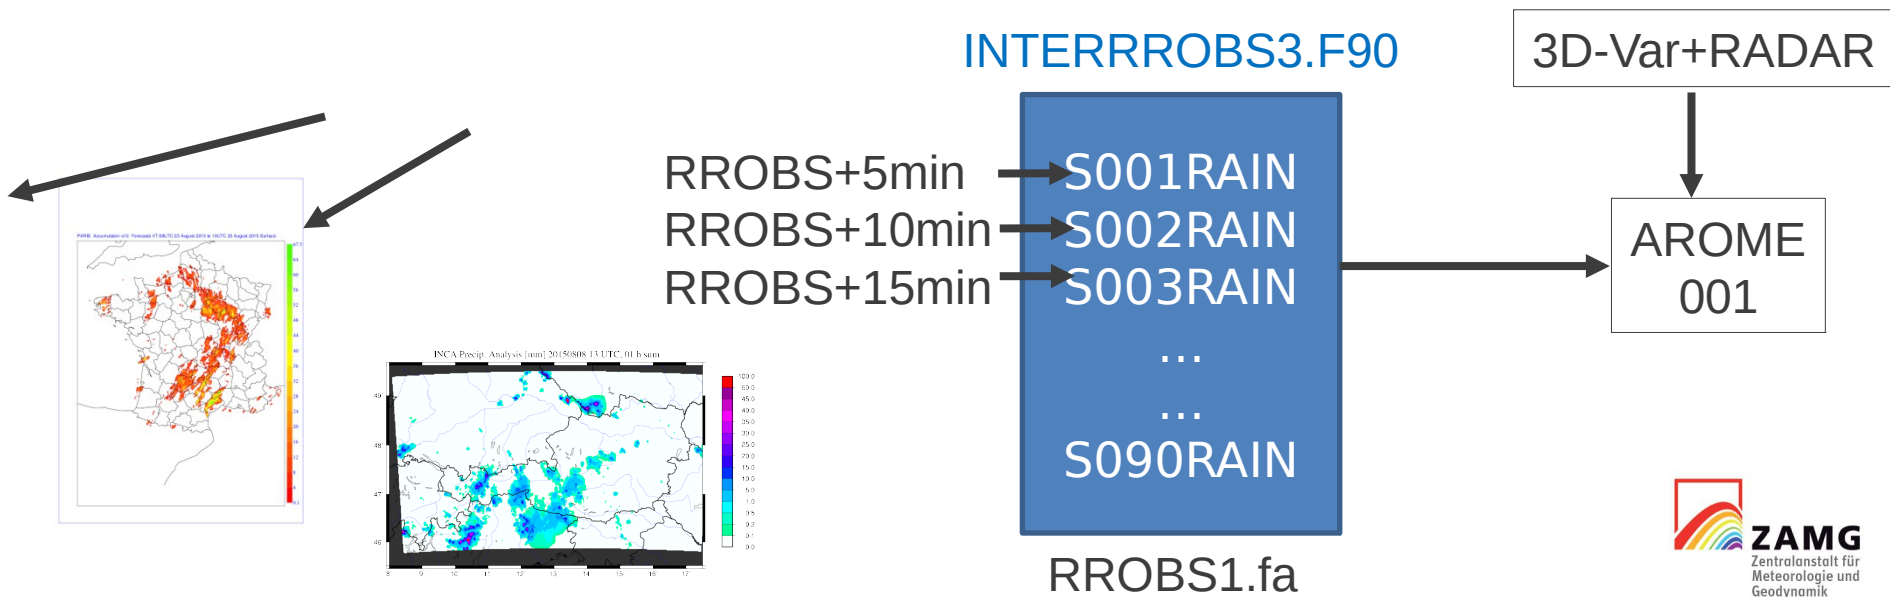

Disadvantages:

- No real 3D information used
- Balances might be violated could cause model „explosions“
- In case of „no rain“ in model an artificial LHN profile is needed
- Time shift between observed (accumulated rain and application of LH tendency)

“Latent Heat Nudging” with AROME cy38t1/cy40t1

AROME
11/10/16

- Interpolation of INCA-5min analyses (+5-+25min) and INCA-forecasts +30-+45min (divided by 3 to get also 5min accumulation periods) to AROME-Nowcasting domain („nearest neighbour“)
- Save in a FA file
- Read FA file and namelist at the beginning of 001
- Apply LHN during integration 001 at defined time steps

Verification: SAL-Score

RADAR+LHN
RADAR but no LHN

Conclusions

AROME
11/10/16

- Experiments from MF stay should be tested for longer period
- Switch to HDF5-reader is OK even if there is still some work to do
 - Optimisation of pre-thinning, Doppler filter from bufr reader (are they necessary?), treatment of quality flags
- LHN shows impact till about +6h: positive in several cases, but neutral to slightly negative (overestimation) on 2 week period – better tuning needed?
- AROME 1.2km is quite promising compared to 2.5km in several cases
