

ALARO in AEMET- γ SREPS Convection-permitting LAM-EPS

ALARO-1 Working Days

SHMI, Bratislava, Slovakia, 11-13 March 2019

AEMET Predictability Group

Alfons Callado, Pau Escribà, Mauri Martínez, David Quintero, David Gil

Outline

- Who are we ? **AEMET predictability group**
- What is **AEMET- γ SREPS**? Design, Operations and Future Developments
- **Some verification** of AEMET- γ SREPS and ALARO in it...
- Update to operational **ALARO1** configuration within HARMONIE and **AEMET- γ SREPS**

Who are we ?

AEMET- γ SREPS Predictability group

- Since 2002 an small core group working on **Limited Area (LAM) Ensemble Prediction Systems (EPS)** depending on Research Department
- Members of **HIRLAM-GLAMEPS-HarmonEPS** and involved in several projects: EUMETNET SRNWP EPS II, PreFlexMS, COASTEPS, EPS eCOST action, etc., and collaborations on EPSs with **IPMA-AEMET**, **AROME-EPS MétéoFrance**, etc.

AEMET- γ SREPS

- Developing a **convection-permitting** LAM-EPS
- **3 sources of uncertainties**

1 INITIAL CONDITIONS

2 BOUNDARY CONDITIONS

3 MODEL ERROR

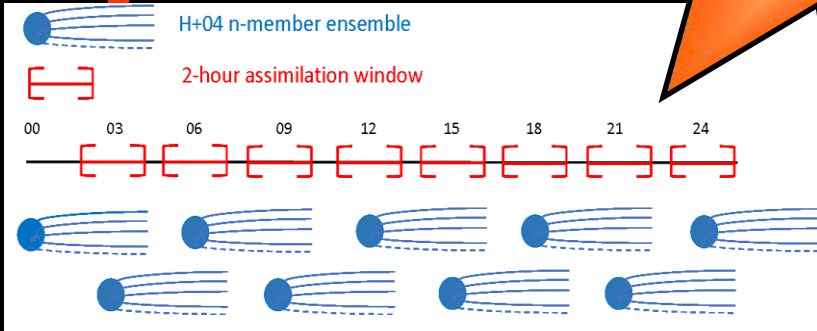

2019 LETKF assimilation

We suffer from the fact that global models available for us have different horizontal/vertical resolutions!

25 members LAM ?

Initial conditions

Multi-model

- HARMONIE-AROME**
- HARMONIE-ALARO**
- WRF-ARW (NCAR)**
- NMMB (NCEP)**

Designing AEMET- γ SREPS

Horizontal resolution in GRIB files

- Intended to run each NWP with the same / very similar internal GRID
- Exactly the same GRIB1 codification output as HARMONIE
 - Lambert 565x469

HARMONIES

lambert

'Nlon' => '576',
'Nlat' => '480',
'Ezone' => '11'
'Gsize' => '2500.'

WRF-ARW

map_proj = 'lambert',
e_we = 566,
e_sn = 470,
dx = 2500,
dy = 2500,

NMNB

map_proj = 'rotated_llb',
e_we = 568,
e_sn = 472,
dx = 0.022545,
dy = 0.022500,

→ NMNB bigger area than HARMONIE to interpolate to common Lambert area without missing values

Vertical levels consistence between models

8

22

- **AROME and ALARO**
 - **65** hybrid sigma-pressure layers
 - **No top**
- **WRF-ARW:**
 - **72** sigma levels → hybrid on 3.9.1. version
 - **Top 40 hPa**
- **NMMB**
 - **72** hybrid levels
 - **Top 40 hPa**

→ Consistency AT LOW LEVELS into the PBL → The very close vertical levels distribution !!!

Summary of models in γ SREPS:

4 NWP MODELS

NWP models' settings

HARMONIEs	WRF-ARW	NMMB
<p>AROME physics ALARO physics</p> <p>65 Hybrid sigma-pressure vertical levels</p> <p>60 s time step</p>	<p>ARW dynamical core</p> <p>6 72 sigma (ETA)</p> <p>hydrostatic-pressure levels up to 40 hPa [there it is 64th HARMONIE vertical level]</p> <p>12 s time step</p>	<p>NMM dynamical core</p> <p>6 72 Hybrid sigma-pressure up to 40 hPa</p> <p>5.625 s time step</p>
<p>Lambert Conformal Conic projection: lon -2.5° / lat 40.0° centre</p> <p>565 * 469 grid-points</p>	<p>Rotated lon-lat B-grid: lon -2.5° / lat 40.0° centre</p> <p>568 * 472 grid-points</p>	
<p>Calling radiation every 15 minutes</p>		
<p>8 LBC relaxation points around grid area</p>		

It has been intended to integrate both NWP models with the closer possible settings in order to be the comparison the more fairly possible.

AEMET- γ SREPS
in operations

γ SREPS at ECMWF Cray XC40

- 00 and 12 UTC cycle over **IBERIA_2.5** domain. 00 UTC cycle over **CANARIAS_2.5** and **LIVINGSTON_2.5** domains.

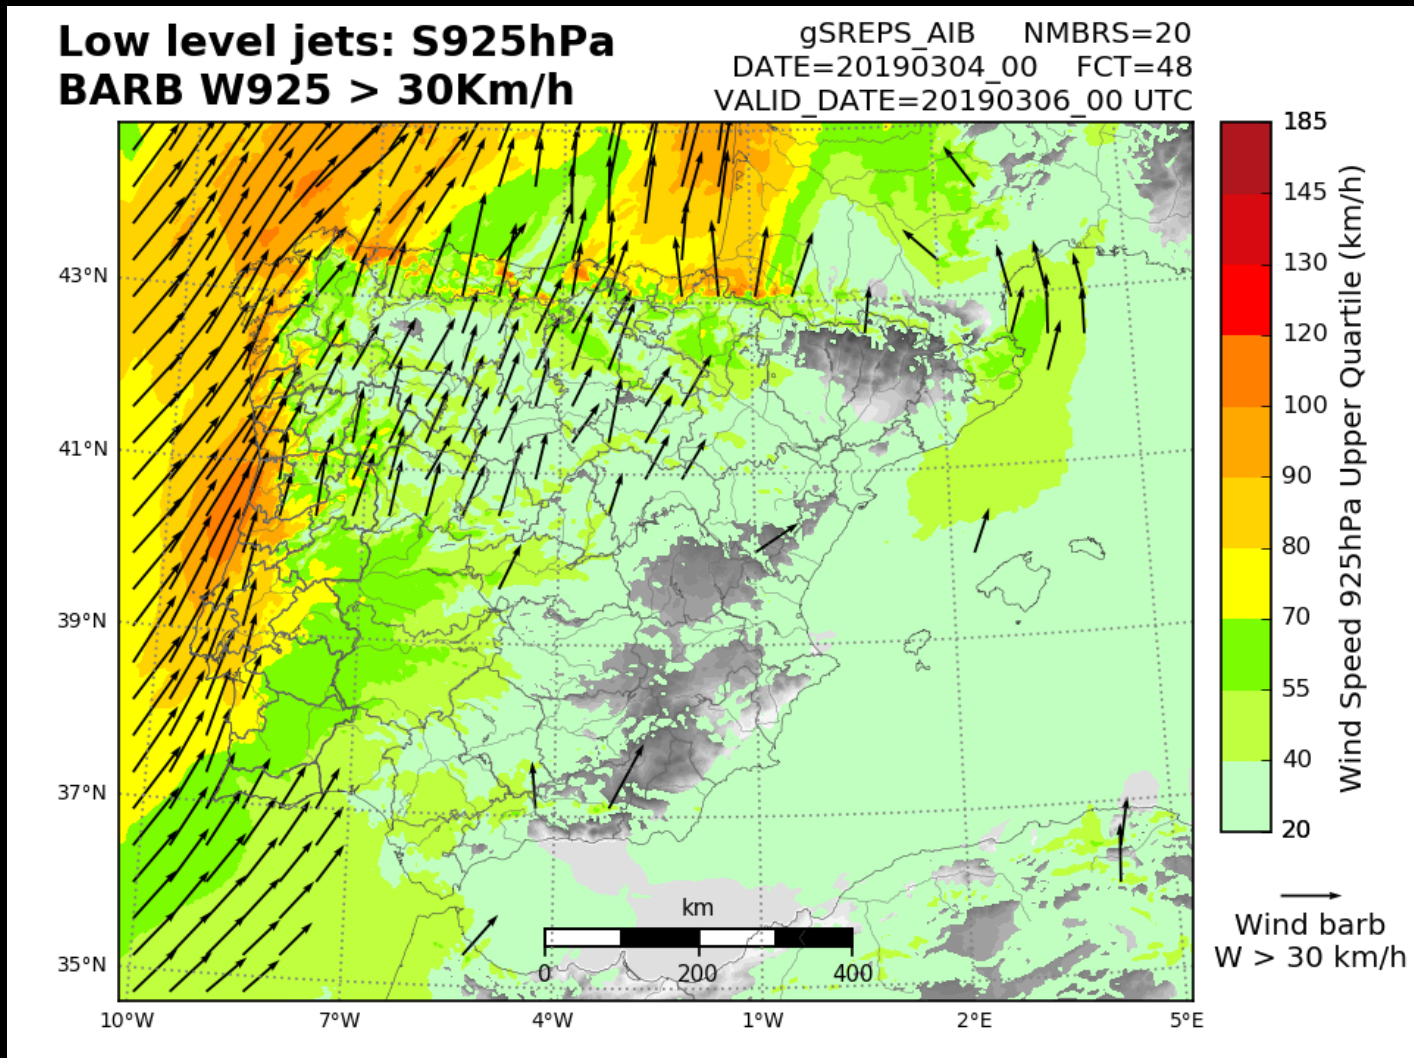

The screenshot shows the 'ecFlowview (4.7.1)' interface. The main window displays a workflow tree for 'gsreps'. The tree structure is as follows:

- gsreps
 - gSREPS_AIB
 - 00
 - YMD: 20190304
 - DOMAIN: IBERIA_2.5
 - 1_bcs
 - 2_eps
 - 3_grb
 - 4_vrf
 - ../2_eps/EPS_control;members_finished gt 0
 - VRF_control
 - VFLD
 - VFLDing
 - nbr001

A red arrow points to the 'VFLDing' node, with the text 'CREATION OF VFLD FILES FOR VERIFICATION' overlaid. The 'ROB' label is visible on the right side of the window.

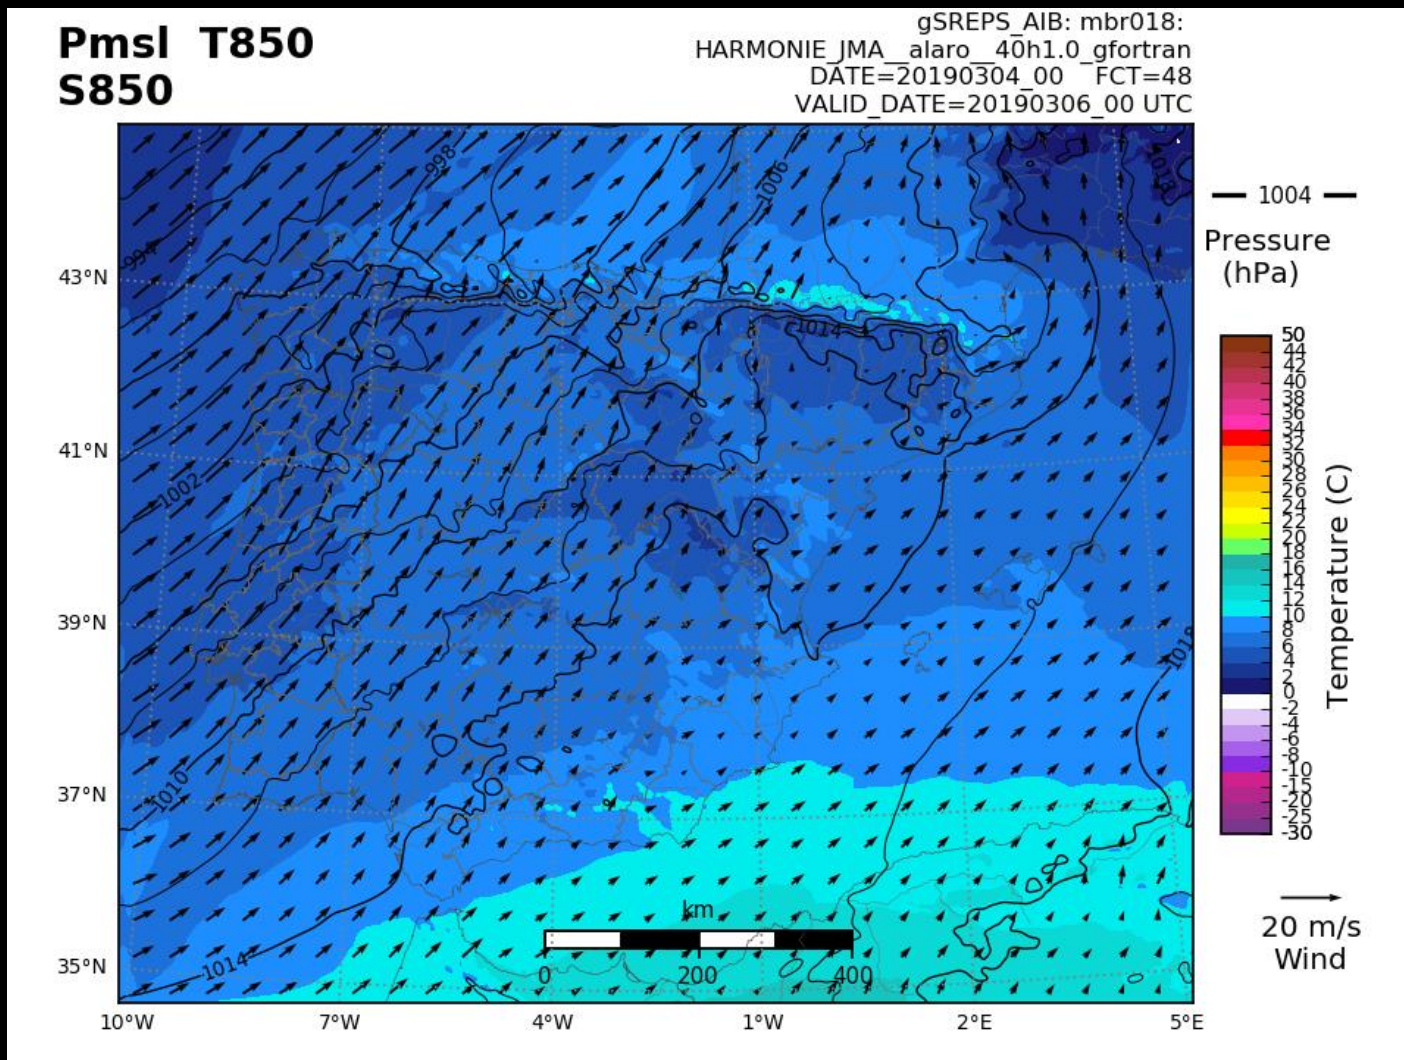

γ SREPS probabilistic products

- Examples of PROBABILISTIC products for the forecasters

γ SREPS deterministic products

- Examples of DETERMINISTIC products. ALARO + JMA/GSM

γ SREPS and AEMET forecasters

- In total more than 3000 products per cycle for forecasters
- At the moment, AEMET- γ SREPS is being used operationally in the whole AEMET forecasting system: Iberia, Canarias, Antarctica...
- From forecasters we have some interesting feedback:
 - It **increases the trust** in the forecast of **intense convective precipitation**, either in **spatial and temporal localization**. Specially very useful the “spaguetti” plot for **precipitation thresholds**
 - **Localization of strong winds** (gusts) looking at g10m mean fields allows better identification and discarding of zones of occurrence
 - Others??? (Few cases of snow to evaluate...)
 - More potential to be experienced... (I say this ☺!!)
- The **usefulness** of the tool should **depend on the complicated weather patterns in each region**: Convective Precipitation in the Mediterranean, Strong Winds in the Atlantic, Fogs in the Baltic Sea, ...

**Current and future
 γ SREPS
developments**

Foreseeable future work plan: 2018-2020

γ SREPS “scientific” developments:

- Assimilation: **LETKF** without discarding **3DVAR...** [\rightarrow *Pau*]
 - **GNSS+RADAR** assimilation [\leftrightarrow *Jana Sánchez*]

- **25 members** [\leftrightarrow Including the 5th mesoscale convection-permitting NWP model:
 ζ Canadian **GEM-LAM?** [\rightarrow *Alfons*]
- **15'** stream output for high social-economic variables' impact as **T2m** and **UV10m**

Foreseeable future work plan: 2018-2020

γ SREPS

**Objective
VERIFICATION**

Understanding verification here...

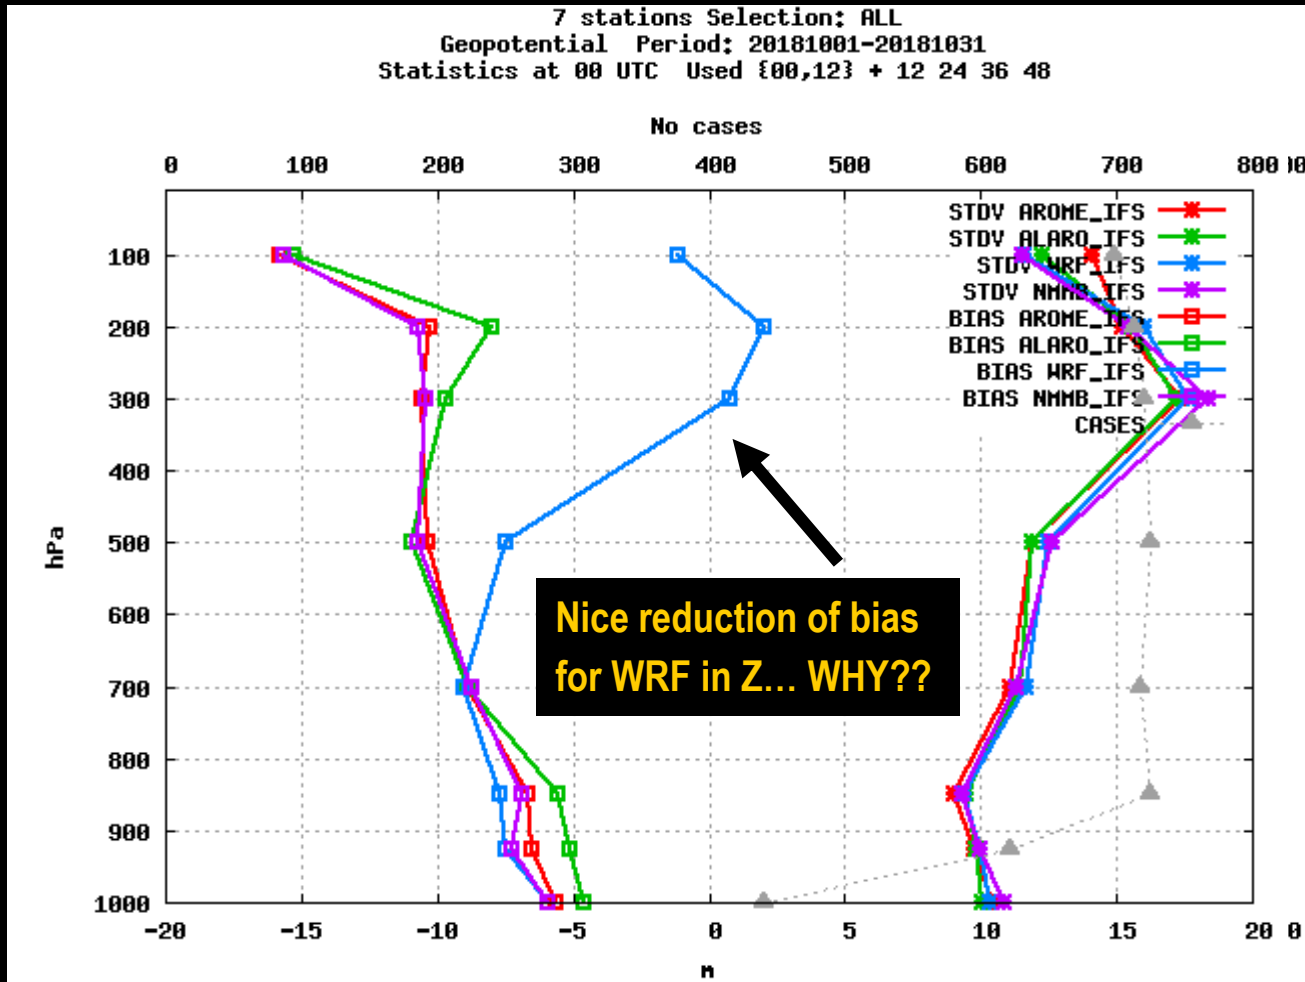

- Deterministic verification of the **4 IFS members subensemble** for 00 and 12 cycle of all **October 2018** is presented, to simplify
- Probabilistic verification of all **gSREPS 20 members** for 00 and 12 cycles only for **AccPcp12** of all **November 2018** is also presented.
- Both verifications have a lot of data....
- At the moment, **ALARO** members are running with **SURFEX** and **not following the reference configuration** of ALARO world. Work to address this in progress...
- Very important... **NO Data assimilation is done** either in Upper Air and Surface... So, a lot of potential of improving all these results.... To start this year!

DETERMINISITIC: IFS members

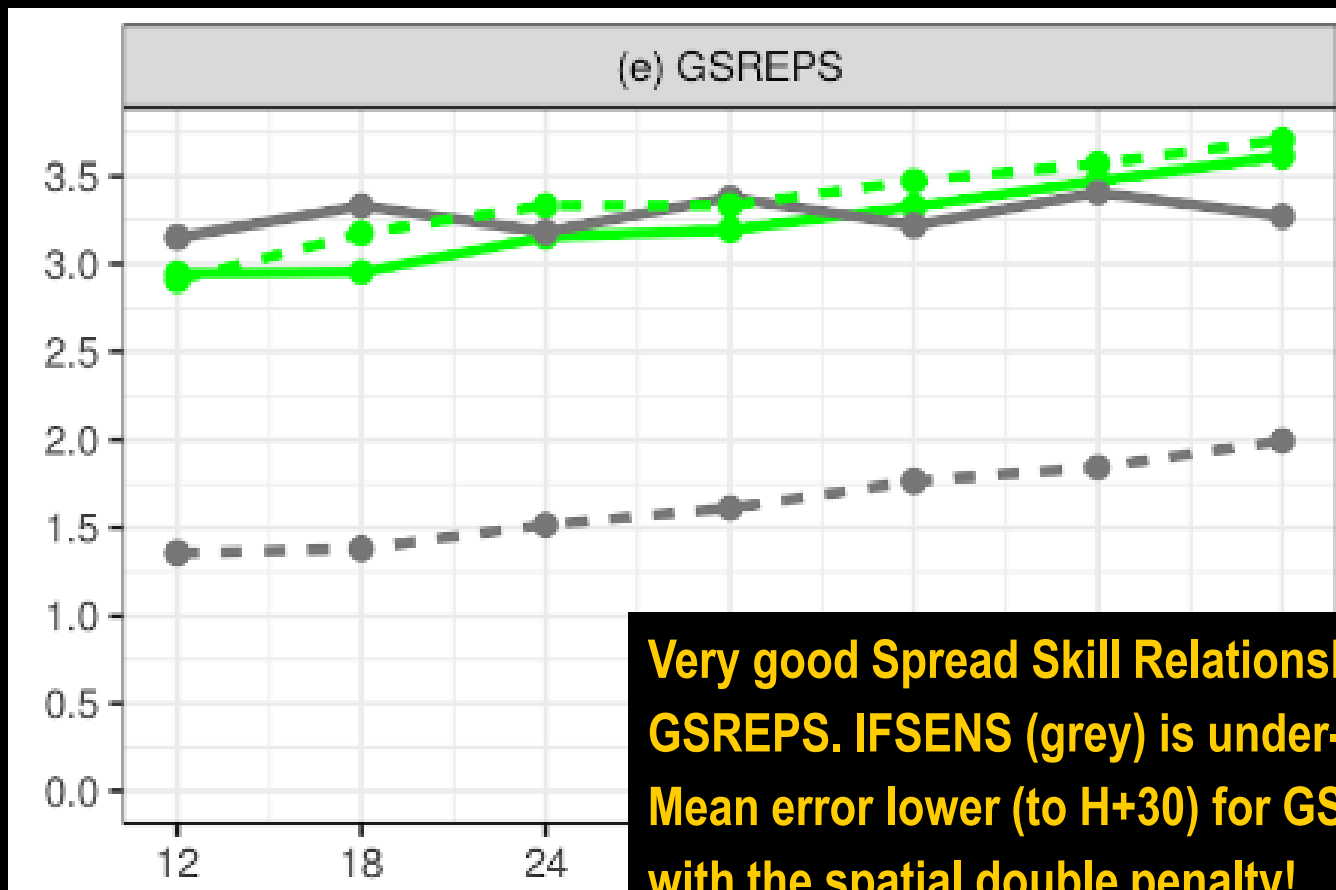

- Verification of the 4 IFS members subensemble. October 2018

PROBABILISTIC: All 20 members

- Recent result for a coming paper about HarmonieEPS systems. Comparison of **12AccPcp** for **00 and 12 cycles of November 2018**

γ SREPS

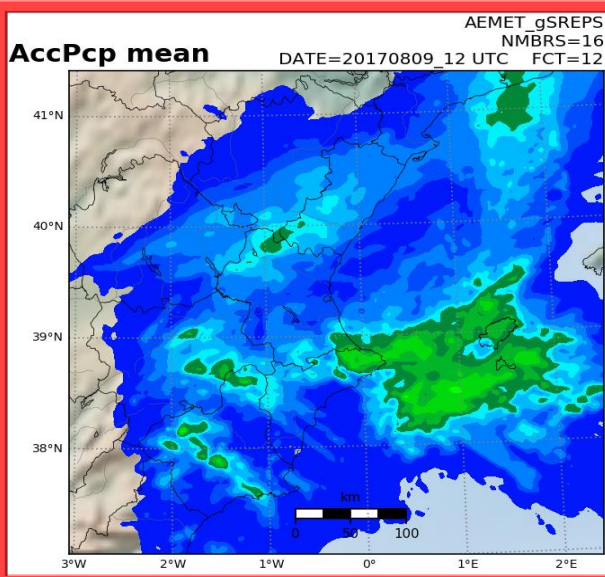

Subjective VERIFICATION

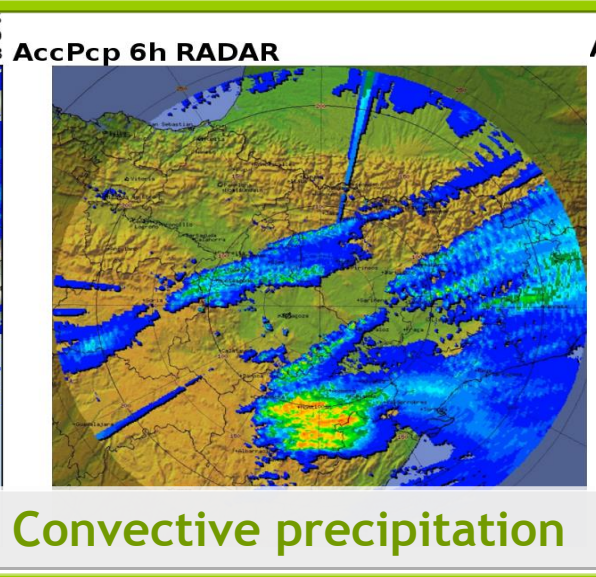

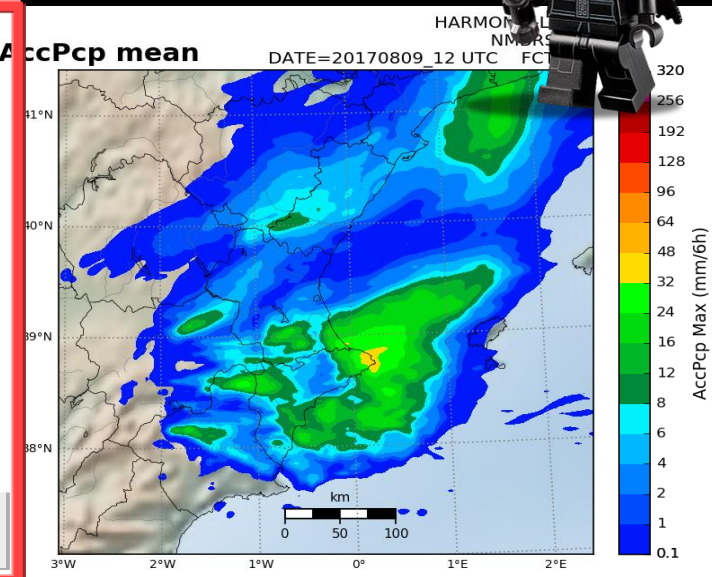

**See *Pau Escribà*
presentation
for more subjective
verifications cases**

Not significant
conclusions ... based on
only few cases !!!

Qualitative verification results

Stratiform precipitation

Convective precipitation

Maresme

case study: low predictability

COASTEPS

AEMET-γSREPS

→ From ECMWF BCs not thunderstorm is developed !!!

**Update to operational
ALARO1 configuration
within HARMONIE and
AEMET- γ SREPS**

ALARO1 update in HARMONIE

- **ALARO** has been a **canonical configuration** in the HARMONIE package for many years
- Recently it has been decided that only HARMONIE partners that use ALARO will be the maintainers of this configuration. We are **AEMET** (Spain) and **RMI** (Belgium)
- Work has been devoted to update HARMONIE tag **40h111**, at the level of **cy40t1bf7**, to make ALARO1 configuration the same as *reference* (**???**) in ALARO world. This work has been done specially with **Neva Pristov** and with **Maria Derkova**, **Petra Smolikova** and **Antonin Bucanek**. Thanks to all!

ALARO1 update in HARMONIE

- The aim of this work is to keep **HARMONIE package updated with ALARO reference**, to be used by everybody. Obviously this must be **discussed with RMI (Geert, Piet)** since they are the experts 😊.
- In particular, the idea is **not to run SURFEX in tag 40h111** with ALARO... (this was not the case in HARMONIE). **In HARMONIE cy43, NON-SURFEX configurations are abandoned...** (hope this is not a problem 😊!)
- At the moment **ALARO can run with Forecast & Assimilation (3DVAR and LETKF) in tag 40h111** either in warm start and cold start... but there are still some issues to address...

ALARO1 update in HARMONIE

- **Compilation/run of HARMONIE-ALARO 40h111 is being done in ECMWF HPCF. gfortran compiler**
- **Funny changes we have had to do:**
 - **-finit-local-zero** compilation option, otherwise crash in 3MT parameterization of convection
 - In subroutine **actkehmt.F90**, when **cold start in snow weather situation**, we have some grid point with a value of **thermal roughness length** so small that Fortran traduces it to **0**. This is a crash. If I put a minimum value = **epsilon()**, it works! The question here is, **which must be the minimum value of thermal roughness length?** I think this is not trivial...
- **Finally a (possibly) problematic issue is that climatic files from our HARMONIE-ALARO are not the same as the ones used by you, ALARO reference 😊. This must be revised!**

Happy AEMET- γ SREPSing !!!
